

Interactive PIT tag data collection using a Microsoft Access form interface

Bill Bosch
Yakama Nation

This poster demonstrates software that allows you to interface a portable DF PIT reader with a Microsoft Access form using either a serial or USB port (e.g., PIT tags read on the reader are automatically displayed on the form). The software uses code that is supported through the Microsoft Applications Programmer Interface (API). This software is not intended as a substitute for P3, but rather as an alternative to manual data recording (and all of the error inherent in a manual process) for field applications for which P3 may not be well suited.
