I. Overview

Passive Integrated Transponder (PIT) tags have been used since 1987 to monitor the movement and behavior of anadromous salmonids in the Columbia and Snake river basins. The PIT Tag Information System (PTAGIS) was implemented in 1991 to manage the collection, correlation, and exchange of Columbia River Basin PIT tag data. PTAGIS encompasses dedicated data collection software, a centralized relational database management system, and standardized data descriptions and reporting processes.

There are four general classes of PIT tag events represented in the PTAGIS database. The relationships between these different events are shown in the diagram below. Every unique PIT tag code in the database is expected to have a single **Tag and Release Event**, and a single entry in the database for this event. Subsequent to release, a PIT-tagged fish may be physically recaptured one or more times. Each recapture is a separate **Recapture and Re-release Event**, and each of these events has a separate entry in the PTAGIS database. If, during a recapture event, a PIT-tagged fish dies, or a PIT tag from a previously-released fish is recovered, then the observed or inferred death is recorded as a **Mortality Event**, and the PTAGIS database receives a single entry for each such event. Each of these three events is recorded, and reported to PTAGIS, in a *Tagging File*. A single Tagging File may contain entries for any one, two or all three of the **Tag and Release**, **Recapture and Re-release**, and **Mortality** events.

There are PIT tag interrogation systems deployed at numerous locations throughout the Columbia and Snake river basins. The tag codes of PIT-tagged fish are passively detected when the fish swim through or past one or more transceiver antennas at these locations. Each of these passive interrogations is recorded as an Interrogation Event, and entered into an *Interrogation File*. Many interrogation sites employ an array of antennas, resulting in multiple detections per site. In addition, a single tagged-and-released fish may encounter, and be passively detected at, multiple interrogation sites as the fish migrates downstream to the ocean, and yet again as it returns to freshwater to spawn.

The PTAGIS database has been designed, modified, and refined to incorporate, relate, and report detailed information about PIT-tagged fish, using the four classes of the Data Event Model. This Specification Document has been prepared to ensure that all PIT tag data entry to, and retrieval from, the PTAGIS database is consistent with the Model. Database flexibility exists to modify data inputs as the Model evolves. However, all proposed changes to this document must be reviewed annually by the PIT Tag Steering Committee (PTSC). Review and modification of this Specification Document will occur annually prior to February. Questions concerning this document should be addressed to the PIT Tag Steering Committee (PTSC) members (see PIT Tag Steering Committee Members, in Section IV).

II. 2001 Changes

The following is a list of significant changes made to the 2001 PIT Tag Specifications Document:

- 1. No tagging detail records are required in Tagging Files. The previous requirement for one or more tag detail records within a Tagging File has been rescinded.
- 2. The Mortality, Release Information, and Monitored Release file types are obsolete, and no longer recognized by PTAGIS processes.
- 3. The defined length of the Conditional (Flag Codes) field in a tag detail record of a Tagging File has been shortened from 50 characters to 11 characters, reflecting an existing constraint of that field in the **PTAGIS3** database.
- 4. Additional examples have been included, and conventions of use detailed, to illustrate the typical application of the PTAGIS code sets and format standards in various data collection and retrieval situations.

This document contains the complete versions of the PTAGIS validation code lists as of April 3, 2001. The reader can obtain the latest version of each list directly from the PTAGIS web site at:

http://www.psmfc.org/pittag/DB_Codes/index.html

III. Data File Definitions

Three data file types are currently recognized by the PTAGIS system: Tagging, MiniMon Interrogation, and MultiMon Interrogation. All files must be in ASCII format and cannot contain non-printable characters (*e.g.*, <ESC> or <TAB>). Within each data class, all records must comply with the following specifications. The first record of Tagging and MiniMon Interrogation data files will be the "FILE TYPE" record.

Format: "FILE TYPE" starting at line 1 in column 5; a colon (:) in column 36; and the File Type identifier starting in column 38 ("TAGGING" or "INTERROGATION").

A. Tagging File

A Tagging File is used to provide information on the marking (and release) of newly-marked fish. The Tagging File may also include information on the recapture and/or mortality of previously PIT-tagged fish.

PTAGIS will accept Tagging Files created by the *PITTAG2.EXE* program. PTAGIS will also accept files created with the DOS programs *PITTAG.EXE* version 7.1 or *BIOMARK.EXE* version 4.02, providing those files are subsequently validated with the *PITTAG2.EXE* program, or are independently validated for content and format using the separate *PITVAL.EXE* program (version 2.1). The current version of the *PITTAG2.EXE* program is available from the *PITTAG Operations* Center (PTOC) at the Pacific States Marine Fisheries Commission (PSMFC).

A Tagging File consists of seven record categories. PTAGIS requires that the Tagging File contain a single record each of the File Type, Program Version, Session or Project Message, and End of File Record types, and exactly 19 Header records. A tagging file contains zero or more Tag Detail records. The inclusion of one or more Note records is optional; the only caveat is that a Variable Release Time Definition note record is required for each unique release time variable used in the Tag Detail record(s).

In the ASCII output file, each **Tag Detail** record is distinguished by a right justified sequence number in columns 1-4. The contents of all other record types are preceded by spaces (ASCII character 32dec./ØH2Ø) in columns 1-4. The **File Type**, **Program Version**, **Header**, and **End of File Record** definitions are all formatted as follows: record declaration begins in column five, a colon (":") appears in column 36, and the record contents are displayed beginning in column 38. The individual Tagging File record types are defined in detail below.

1. File Type Record

Format: "FILE TYPE" starting in column 5; a colon (:) in column 36; and "TAGGING" starting in column 38. This record is generated by the software on the first line of the ASCII output file. This is a required record.

FILE TYPE

: TAGGING

2. Program Version Record

The only valid program version declarations are:

- PITTAG2.EXE 1.04; OR
- PITTAG.EXE 7.1; PITVAL.EXE 2.1; OR
- BIOMARK.EXE 4.02; PITVAL.EXE 2.1

This record is generated by the software on the second line of the ASCII output file. This is a required record.

3. Session Message

Text, 76 character input maximum. This required record is formatted by the software; and is delimited by dashed sequences on lines three and five of the ASCII output file. While the exact record content is left to the user's discretion, the Session Message should provide a summary of the purpose or scope of the tagging project.

Example 1: Typical Session Message

SPCA habitat utilization study in Swimin River drainage, 2001

4. Header Records

The label contents, order, and format of the header records are standardized and cannot be changed. These are required records. The mandatory inclusion of record contents may be required, as individually noted.

FIELD NAME	CONTENT	MANDATORY/OPTIONAL

a. FILE TITLE

This required format is autogenerated by the *PITTAG2.EXE* program and specifies the threecharacter (xxx) ID (initials) of the individual tagging supervisor and the day-of-year (YYDDD). The contents of the extension (zzz) are left to the discretion of the tagging supervisor. However, as all data files submitted to PTAGIS must have unique titles, it is imperative that the "file name.extension" combination not conflict with any other PIT tag data files generated within the Columbia Basin.

xxxYYDDD.zzz

b. TAG DATE

MM/DD/YY hh:mm Mandatory

This field records the date the tag data was collected. The value is generated by the software, and defaults to the current computer date and time. This value can be modified in *PITTAG2.EXE*. When the Tagging File contains records of PIT tag releases or recaptures/mortalities collected over multiple days then, by convention, the **Tag Date** field should contain the first day of sampling effort, the **Release Date** field (see below) should reference the last day of sampling effort, the actual dates of PIT tag release/recovery should be denoted using **Variable Release Times** (see below), and the procedure should be documented in a session **Note** (see below) preceding the first **Tag Detail** record (see below).

Mandatory

	FIELD NAME	CONTENT	MANDATORY/OPTIONAL
c.	TAGGER	Lastname I	Mandatory
	This field records the tagging super and first initial, to a maximum of 15	rvisor or primary tagger's last 5 characters.	name, followed by a space
d.	HATCHERY SITE	[Valid Hatchery]	Optional
	When fish are tagged at a hatchery, domain of hatchery codes (see Hat	this field contains the four-ch chery Codes in Section IV)	aracter abbreviation from the
e.	STOCK	Text	Optional
	This field contains a description of characters.	the genetic or geographic stoc	k to a maximum of 15
f.	BROOD YR	nn	Optional
	This field contains the last two digit collected, if known.	s of the calendar year when e	ggs were deposited or
g.	MIGRATORY YR	nn	Mandatory
	This field contains the last two digit migrate. For a recapture/mortality of current calendar year.	s of the earliest possible caler event, or if adults are tagged, t	idar year when fish will out- this value references the
h.	TAG SITE	[Valid Tag Site]	Mandatory
	This field contains a code (between were marked (see Tag and Relea this code designates the recapture si	n three and six characters) de se Site Codes in Section IV te.	enoting the site where the fish $$. During a recapture event,
i.	RACEWAY/TRANSECT	Text	Optional
	This field contains an abbreviated d characters.	escription of the sampling loc	ation, to a maximum of six
j.	CAPTURE METHOD	[Valid Capture Meth	od] Mandatory
	This field contains a code (up to six captured for marking (or recaptured	characters) denoting the meth () (see Capture Method Co	hod by which the fish were o des in Section IV).
k.	TAGGING TEMP	nn.n	Mandatory
	This field contains the temperature 25.0 should be entered if the water t (<i>e.g.</i> , a multi-week recapture session	(00.0-25.0°C, inclusive) of the emperature is not available, on a).	e tagging water. A value of r the value is not applicable
].	POST TAGGING TEMP	nn.n	Optional
	When there is a significant time inter this field contains the temperature (rval between the marking and 00.0-25.0°C, inclusive) of the	l release of PIT-tagged fish, water in the post-tagging

holding facilities (e.g., an outdoor raceway).

Section IV).

applicable (e.g., a multi-week recapture session). [Valid Tagging Method] TAGGING METHOD tagged fish, the value is "NONE". ORGANIZATION [Valid Organization] PIT tag marking or recovery activity. (see Organization Codes in Section IV). COORDINATOR ID [Valid Coordinator ID] recovery activity (see Coordinator ID Codes in Section IV). **RELEASE DATE** MM/DD/YY hh:mm This field contains the date and time of Release, in Pacific Standard Time (PST). During a recapture event, this code designates the re-release date. This record is required when the Date field (see above) should contain the first day of sampling effort. Under these circumstances, the Release Date field should reference the last day of sampling effort, the first Tag Detail record (see below). **RELEASE SITE** [Valid Release Site] This field contains a code (between four and six characters) denoting the site where the tagged IV). Cond. Mand.* **RELEASE RIVER KM** nnn(.nnn) This field contains a series of three-digit values, separated by periods, corresponding to the lengths of river segments (in kilometers) between the mouth of the Columbia River and the release site. The length of the field is between three and 27 characters. This field is required when the Tagging File provides Release Information (see **Tag and Release Site Codes** in

*Cond. Mand (Conditionally Mandatory): If any of the four header fields related to release information (Release Water Temp, Release Date, Release Site, or Release River KM) is submitted with data, then all four of those header records must contain data. In addition, if Variable Release Times are declared and defined within the Tag Detail records, all four Release Information header records must be completed.

This field contains the temperature (00.0-25.0°C, inclusive) of the water the tagged fish were released into. This field is required when the Tagging File provides Release Information. A value of **25.0** should be entered if the water temperature is not available, or the value is not

CONTENT

Mandatory n.

nn.n

This field contains the (abbreviated) four-character method by which PIT tags were inserted into the fish. If all Tag Detail records in the file refer to the recapture or mortality of previously

	1. PO	SITIONAL COMMENTS		
	Onl 41-4	y Positional Comments defined in this specification 5 of the ASCII output file. The Positional Comme	n document may app ents currently specifi	ear in columns ed are as follows:
	А.	SPECIES	41	Mandatory
		Single-digit integer. (See Species Codes in Sec	ction IV.)	
	B.	RUN	42	Mandatory
		Single-digit integer. (See Run Codes in Section	n IV.)	

¹ PIT Tags can only be re-used in the Columbia River system if each tag is removed from the fish and the tag code is removed or changed to ten periods (.....) prior to the Tagging File being submitted to PTAGIS. All other fields in the record should remain intact for future reference. PIT Tags from recaptured fish CAN NOT be re-used, and must NOT be "dotted out."

FIELD NAME, DETAILS	COL. #	MAND./OPT.
C. REARING TYPE	43	Mandatory

Single-character text. (See Rearing Type Codes in Section IV.)

Standard Codes Used to Identify PIT-Tagged Fish

in the PIT Tag Information System

There are 126 possible combinations of Species, Run, and Rearing Type codes. The following list contains the 26 "standard" combinations currently used to describe PIT-tagged fish in the Columbia and Snake river basins.

- 00U Unknown (fish not observed or bare tag)
- 11H Hatchery Spring Chinook
- 11U Spring Chinook (rearing type unknown)
- 11W Wild Spring Chinook
- 12H Hatchery Summer Chinook
- 12U Summer Chinook (rearing type unknown)
- 12W Wild Summer Chinook
- 13H Hatchery Fall Chinook
- 13U Fall Chinook (rearing type unknown)
- 13W Wild Fall Chinook
- 15H Hatchery Chinook (run designation unknown)
- 15U Chinook (run designation and rearing type unknown)
- 15W Wild Chinook (run designation unknown)
- 25H Hatchery Coho
- 25U Coho (rearing type unknown)
- 25W Wild Coho
- 32H Hatchery (Summer) Steelhead
- 32U (Summer) Steelhead (rearing type unknown)
- 32W- Wild (Summer) Steelhead
- 42H Hatchery Sockeye Stanley Basin
- 42U Sockeye (rearing type unknown) Stanley Basin
- 42W Wild Sockeye Stanley Basin
- 45H Hatchery Sockeye
- 45U Sockeye (rearing type unknown)
- 45W- Wild Sockeye
- 90U Anything other than an anadromous salmonid

FIELD NAME, DETAILS

D. RELEASE TIME VARIABLE

collected over multiple days then, by convention, the Tag Date field (see above) should contain the first day of sampling effort. Under these circumstances, the Release Date field (see above) should reference the last day of sampling effort, the actual dates of PIT tag release/recovery should be denoted using Variable Release Times (see below), and the procedure should be documented in a session Note (see below) preceding the first Tag Detail record.

Two digits. This value allows users to specify multiple release times for Tag Detail records in a single file. Valid values are 00-99, inclusive. Each unique Release Time Variable used must have a corresponding accompanying note record that reports the

actual date and time of release (see 6. Note Records in Section III.6).

Е. ADDITIONAL POSITIONAL COMMENTS Var. Optional

Up to 45 columns of Additional Positional Comments, required by individual research projects, may appear after column 45, but will not be recognized by PTAGIS without prior PIT Tag Steering Committee approval.

2. CONDITIONAL COMMENTS Var. Optional

Conditional Comments, also known as Flag Codes, are used to systematically catalog a variety of morphological, environmental, and logical factors associated with a specific tagged fish. Conditional Comments, if present, appear after any Additional Positional Comments and are preceded by a single vertical bar symbol ("|", ASCII 124dec./ØH7C) and are delimited with a single space. This field can hold up to 11 characters, including the space separators. Only Conditional Comments approved by the PTSC will be recognized by PTAGIS (see Conditional Comments (Flag Codes) in Section IV).

MAND./OPT.

Optional

COL.#

44-45

By default, the **Tag Detail Record** describes a new **Tagging** event. However, the presence of specific Flag Codes in the Tag Detail Record denote either a **Recapture** or **Mortality** event, as described below.

- **Recapture Events:** A recapture is defined as a previously PIT-tagged fish that is handled subsequent to the release event. The Tagging File is used to record recaptures. The flag code **RE** <u>must</u> be added to each recapture tag record in the Tagging File. If all of the tag records in the Tagging File reference recaptured fish, then the Header records will also reference those Recapture Events. In such a case, for example, the Tag Site will actually denote the Recapture Site, and the Release Date will serve as the re-Release Date. In cases where there is a question about how to set a Header Record value, defer to the judgement of the tagging coordinator or study designer.
- Mortality Events:A mortality is defined as a PIT tag that is recovered, with or without
its host animal, subsequent to the tagged release of that animal. One
of the defined mortality flag codes (M, MB, MK, MS, SM) must be
added to each corresponding mortality tag record in the Tagging File.
PIT Tags recovered from Mortality Events are to be returned to the
PTOC. The death of tagged fish and/or the retrieval of those tags
prior to release are not considered to be Mortality Events. Under such
circumstances, the original owner of the tag can remove ("dot-out")
the reference to that tagging File to PTAGIS, and then re-use the tag as part
of a new tagging event.
- Adult Returns: PIT-tagged fish returning to spawning locations may be recorded as Tagging, Recapture, or Mortality events. In addition to any required recapture or mortality code, all returning fish should be flagged with an RF code, plus MT (for "Mature"), JA (for "Jack"), or MJ (for "MiniJack"), as appropriate.

3. TEXTUAL COMMENTS Var. Optional

Textual Comments are separated from Conditional Comments by a single vertical bar symbol. If no Conditional Comments are present, Textual Comments are preceded by two vertical bar symbols "||" and consist of information specific to the individual fish. This field can hold up to 50 alphanumeric characters, including ASCII punctuation.

6. Note Records

Most Note Records are *ad hoc* annotations to the data file. Global comments pertaining to the tagging session are generally entered between the header and first Tagging Detail record, using the Session Note function in *PITTAG2.EXE*. Additional comments can be added during the tagging session. The format and content of all Note Records are ignored by PTAGIS, except in the case of Variable Release Time Declarations (explained below).

Format: VARIABLE RELEASE TIME DECLARATION: (One required for each unique release time variable used in the Tagging Detail records.) The VRT declaration begins with an upper case "V" in column five, followed by the two digit release variable (nn) in columns six and seven, an equals sign "=" in column eight, the two digit month (MM) in columns nine and ten, a slash (/) in column 11, the two digit day (DD) in columns 12 and 13, a slash (/) in column 14, the two digit year (YY) in columns 15 and 16, a space in column 17, the two digit military-style hour (hh, 00-23) of release, in Pacific Standard time, in column 18 and 19, a colon (:) in column 20, and the two digit minutes (mm) of release in columns 21 and 22.

Vnn=MM/DD/YY hh:mm

e.g., V01=04/08/01 16:45

When the Tagging File contains records of PIT tag releases or recaptures/mortalities collected over multiple days then, by convention, the Tag Date field (see above) should contain the first day of sampling effort. Under these circumstances, the Release Date field (see above) should reference the last day of sampling effort, the actual dates of PIT tag release/recovery should be denoted using Variable Release Times, and the procedure should be documented in a session Note (see above) preceding the first Tag Detail record (see above).

7. End of File Record

The End of File record uses the same positional formatting as HEADER records. The record is created by the software and is required by PTAGIS as the last record in the file.

Format: CLOSE DATE: Beginning in column 5, a colon (":") at column 36, and a date/time stamp (MM/DD/YY hh:mm) starting at column 38. The time is formatted as Pacific Standard Time (PST).

CLOSE DATE

: 06/09/01 14:50

SEASONAL SUMMARY OF PIT TAG RECAPTURES AT KILLUM FALLS TRAP. SAMPLING OCCURRED 24x7 BETWEEN 4/1/01 AND 6/1/01, AS SHOWN IN THE TAG DATE AND HEADER RELEASE DATE FIELDS. TRAP WAS CHECKED DAILY. COLLECTED FISH WERE RE-RELEASED 100M ABOVE TRAP.

IT'S POSSIBLE TO ENTER RECORD-SPECIFIC COMMENTS DIRECTLY AFTER THAT RECORD, BUT IT'S MORE LEGIBLE TO REFERENCE THOSE RECORDS HERE IN THE SUMMARY. SO...

THE ADULT IN RECORD #5 WAS RETRIEVED FROM THE MOUTH OF THE TRAP, SCANNED, AND ALLOWED TO RECOVER BEFORE BEING RE-RELEASED UPSTREAM.

REGARDING THE FISH IN RECORD #1236: HE'S DEAD, JIM.

B. MiniMon Interrogation File

Interrogation files are computer-generated using the MINIMON.EXE program. The format is described below. Interrogation Site Codes, System ID Codes, and Coil ID codes are assigned by the PIT Tag Operations Center (PTOC) when a new system is installed.

Interrogation files consist of five record categories: File Type, Start Message Records, Interrogation Data Records, Other Record Types, and an End of File Record.

1. File Type Record

Format: "FILE TYPE" starting at line 1 in column 5; a colon (:) in column 36; and "INTERROGATION" starting in column 38. This record is generated by the software on the first line of the ASCII file. This is a required record.

FILE TYPE

: INTERROGATION

2. Start Message Records

FIELD NAME

FILE TITLE я.

File Titles are a maximum of 12 characters. The format consists of a three-character site code, two-digit year, and three-digit day-of-year. The alphabetic extension is reserved for partitions (e.g., DOJ01114.A). This record is generated by the software on the second line of the ASCII file. This is a required record.

b. FILE CREATED

Date and time (e.g., 24 April 2001 AT 16:45). This record is generated by the software on the third line of the ASCII file. This is a required record.

3. Interrogation Data Records

Individual records consist of the following required components. Optional.

	FIELD NAME	FORMAT	COLUMN #
a.	DATA TOKEN	" " (a "vertical bar" or "pipe" symbol, ASCII 124dec./ØH7C)	1
b.	PORT ID	Hexadecimal	3-4
c.	DATE	MM/DD/YY	6-13
d.	TIME	hh:mm:ss (PST)	15-22
e.	PITCODE	Hexadecimal	24-37
f.	CHECKSUM	"XX"	39-40
g.	COIL ID	Hexadecimal	42-43

MANDATORY

Mandatory

Mandatory

4. Other Record Types

a. Status and Warning Messages Optional

Records prefaced with a tilde (" \sim ") in the first column contain information regarding site and transceiver operations.

b. Blank Lines Optional

5. End of File Record

c.

FILE CLOSED

Mandatory

Date and time (e.g., 24 April 2001 AT 20:45). This record is generated by the software on the last line of the ASCII file.

Test Tags:Test tags are used to monitor the operation of an interrogation unit. There are two types of test
tags. The first type is referred to colloquially as a stick tag, or formally as a Variable
Reference Tag. These tags are usually embedded in a piece of wood and passed through the
detection field of a monitor. At least 10 test tags should be passed through remote
interrogation systems daily, if possible, to ensure the system is functioning. The second type
of test tag is referred to colloquially as a timer tag or formally as a Fixed Reference Tag.
These "tags" are passive, electronic devices powered by the electro-magnetic field of the
interrogation unit they are testing. Each timer tag is permanently mounted in the unit and fires
at a specified frequency.

ALL TEST TAGS MUST BE REGISTERED WITH PTOC BEFORE USE.

C. MULTIMON File

The **MULTIMON.EXE** program has been developed by the National Marine Fisheries Service for the interrogation of PIT Tagged fish at mainstem collection and sampling facilities. In addition to simply recording interrogation data, **MULTIMON.EXE** is designed to react to the presence of specific fish and trigger electrical or mechanical operations to control the routing of those fish through research facilities. This capability is a keystone of current and proposed Separation by Code activities. The **MULTIMON.EXE** ASCII file output includes not only interrogation records, but configuration and diagnostic records relating to the program's logical processes.

The **MULTIMON.EXE** program is still under development, and the format and content of the various record types is subject to change, although the number and magnitude of additional changes should be insignificant. Please contact PTOC with any questions regarding the content or format of **MULTIMON.EXE** output records, or the current status of program development.

D. Monitored Release File

Monitored Release files were used on a limited basis between 1994 and 1996 to record interrogations of hatchery releases. This information has been translated into standard interrogation data records; release information is contained in the original Tagging files. Monitored Release Files are now obsolete.

E. Mortality File

The information previously provided in the Mortality File format is now provided within the Tagging File as a mortality event. The Mortality File is now obsolete.

F. Release Information File

The information previously provided in the Release Information File format is now incorporated directly into the Tagging File. The Release Information File is now obsolete.

IV. Code Lists

The following are lists of standardized codes used in the Columbia River Basin PIT Tag Information System (PTAGIS). If tagging coordinators have additional codes they would like to use, please submit these to your organization's PIT Tag Steering Committee (PTSC) member for review by the PTSC and inclusion in the next Specification Document.

All code lists in the 2001 PIT Tag Specification Document can be generated from the PTAGIS application. To see the list of valid river reach codes in the PTAGIS application, go to: Reports \rightarrow Reference/Lookup \rightarrow Run Report \rightarrow A. River Reach Codes. To see any of the other codes, go to: Reports \rightarrow Reference/Lookup \rightarrow Run Report \rightarrow B. Validation Codes.

Both sets of codes can also be accessed and downloaded from the Internet at: http://www.psmfc.org/pittag/DB Codes/index.html

A. Species Codes

All detail data records in files submitted to the PTAGIS database must contain a Valid Species Code.

CODE	SPECIES
0	Unknown
1	Chinook
2	Coho
3	Steelhead
4	Sockeye
5	Chum
9	Other

B. Run Codes

All detail data records in files submitted to the PTAGIS database must contain a valid Run Code.

CODE	RUN
0	N/A
1	Spring
2	Summer
3	Fall
4	Winter
5	Unknown

C. Rearing Type Codes

All detail data records in files submitted to the PTAGIS database must contain a valid Rearing Type Code.

CODE	REARING TYPE
H	Hatchery Origin
U	Unknown Origin
W	Wild Fish or Natural Production

D. Coordinator ID Codes

The Coordinator ID code is the initials (two or three) of the project leader responsible for the PIT Tag data (not necessarily the person conducting the tagging or creating the Tagging File). Data files submitted to the PTAGIS database must contain a valid, recognized Coordinator ID code.

J. Tag and Release Site Codes

1. Site Codes

The site code is an abbreviated description (four to six characters) of the tagging and/or release location. A site descriptor, if present, will be found in the last one to three characters. For all site codes that replicate an already established code, a number (2 through 9) will immediately proceed the site descriptor. For example:

ELKC: Elk Creek	ELK2C: A seco	ond Elk Creek	ELK3C: A third Elk Creek
BEARVC: Bear Valley Creek		BEAR2C: A se	cond Bear Valley Creek

The following are valid site descriptors:

B: Bridge	C: Creek	CH: Channel
CN: Canal	D: Dam	FK : fork of a river, but not part
I or IS: Island	P: Pond	of a name (e.g., Salmon River, East Fork, but not Brushy Fork
R : River	S: Screen	Cteek)
SL: Slough	T or TRP: Trap	W: Weir

2. River Kilometer Code

The river kilometer code uses a hierarchical coding scheme: kilometers from the mouth of the Columbia to the Release site (up to 7th order stream for point release sites), with each tributary delimited with a period (*e.g.*, the code for the location of the Lower Granite Dam is 522.173 = 522 km from the mouth of the Columbia to the mouth of the Snake, and 173 km from the mouth of the Snake to the dam). Each segment of the code is three characters long, zero-padded from the left. If additional sites are required, contact your PIT Tag Steering Committee member to add your requests to the list. River kilometer codes have a minimum length of three characters and a maximum length of 27 characters; the domain of characters is generally limited to integers and the period. There is an exception for the OCEAN code (---) and the LAND code (---).

When releasing or recovering fish in-river (as opposed to releasing or recovering at one of the listed fixed-site locations), the distance upstream from the mouth of the river, stream, or creek, is appended (in kilometers) to the base river kilometer code for that river.

For example, a project that is tagging 10 kilometers above the mouth of the Salmon River, South Fork would be identified as:

SALRSF 522.303.215.010

3. GIS Hydrounits

See Appendix B for a more formal treatment of this topic. For the purposes of this system, this is an eight-digit number assigned to areas of land based on drainages. The GIS hydrounits for the recognized site codes are listed below. However, there are several rivers (Columbia, Snake, and Middle Fork of the Salmon) that flow through more than one drainage. The hydrounit codes listed below for these rivers only contain digits that are common to all drainages along the river. For example, for the tagging site COLR (Columbia River), only the first three digits (170) are common to all the areas drained by the Columbia River. To determine the complete GIS Hydrounit code for the site you are tagging at, you will need to know the precise point along the river where you are tagging, and then locate that point on a GIS map (see Appendix D for these maps). Your state or federal representative to the PIT Tag Steering Committee should be able to aid in this.

4. Point Release Sites vs. Fixed Release Sites

In the following two tables, the indicator column labeled "I" contains a "Y" or an "N". This indicator specifies "Y" if the associated Tagging or Release Site is a "Point Release Site", or an "N" otherwise.

A point release site cannot be modified with an additional suffix or segment. Examples of point release sites are dams, weirs, traps, bridges, etc. For release locations upstream from the point release sites, find the code for the confluence of the first stream down from the point release site and then append the suffix you need to that river kilometer value.

5. Tag and Release Site Codes

The codes for these sites, along with their associated river kilometer and GIS hydrounit, are listed in the tables below.

a. Tag and Release Sites Organized by Site Code						
SITE LOCATION NAME			DIVED VM	TOTAL	HYDRO-

.

c. Intra-Dam Release Site Codes

These codes are appended as a suffix to the three-character dam site code and provide a specific location for release at, above, or below hydroelectric facilities. For example, a release into the gatewells at Lower Granite Dam would be coded as LGRGWL. The use of Intra-Dam Release Site Codes has been required since 12/31/99.

SITE	LOCATION NAME
AFF	Adult Fish Facility
BPS	Release into the PIT-Tag Diversion System between the Diversion Gate and the furthest
	downstream PIT-Tag Detector
ВҮР	Release into the Facility Bypass Flume/Pipe
COL	Release into the Collection Channel upstream of the Dewatering Facility
DTG	Release into the Collection Flume/Pipe between the Dewatering Facility and the
	Collection/Bypass Gate
DWT	Release into the Dewatering Facility
FBY	Release into the Forebay within 0.5 km upstream of Dam
GAT	Release into Flume between Separator Exit and the Primary PIT-Tag Diversion Gate
GWL	Release into Gatewell(s)
ICE	Release into the Ice/Trash Sluiceway
LDR	Adult Fish Ladder
MRT	Mortality Recovery
OFL	Release into the PIT-Tag Diversion System downstream of the Last PIT-Tag Detector
ORI	Release into Orifice(s)
RBR	Release below the PIT-Tag Diversion System Gate with subsequent Barge Transportation from
	the Facility
RRR	Release below the PIT-Tag Diversion System Gate with subsequent Return to the River at the
	Facility
RTR	Release below the PIT-Tag Diversion System Gate with subsequent Truck Transportation from
	the Facility
RXR	Release below the PIT-Tag Diversion System Gate with subsequent Transportation from the
	Facility
SEP	Release into the Flume downsteam of the Collection/Bypass Gate or into the Separator
SPF	Release into the Forebay within 0.5 km upstream of Spillway
SPL	Release directly into Spill Bay(s)
SPT	Release into the Tailrace within 0.5 km downstream of Spillway
STS	Release onto the Submerged Traveling Screen
TAL	Release into the Tailrace within 0.5 km downstream of Dam
TRB	Release into Turbine(s)

K. PIT Tag Steering Committee Members, 2001

Ed Buettner, Chair

Idaho Department of Fish & Game 1540 Warner Ave. Lewiston, ID 83501 ebuettne@idfg.state.id.us Ph: (208) 799-3475 Fax: (208) 799-5012

Doug Marsh

National Marine Fisheries Service 2725 Montlake Blvd. Seattle, WA 98112 doug.marsh@noaa.gov Ph: (206) 860-3235 Fax: (206) 860-3267

Charles Morrill

Washington Department of Fish & Wildlife 600 N. Capitol Way Olympia, WA 98504 *cfwdfw@aol.com* Ph: (360) 902-2747 Fax: (360) 902-2183

Ann Setter

Oregon Department of Fish & Wildlife 65495 Alder Slope Rd. Enterprise, OR 97828 *asetter@oregonVOS.net* Ph: (541) 426-9052 Fax: (541) 426-3055

Carter Stein

Pacific States Marine Fisheries Commission 45 SE 82nd Drive, Suite 100 Gladstone, OR 97027 *carters@psmfc.org* Ph: (503) 650-5400 Fax: (503) 650-5426

David Wills

U.S. Fish & Wildlife Service 9317 NE Hwy 99, Suite I Vancouver, WA 98665 *David_Wills@fws.gov* Ph: (360) 696-7605 Fax: (360) 696-7968

V. Glossary of Terms

ASSOCIATED MARKS

A field in a Release Information File used to record identifying marks, other than PIT tags, associated with a group of fish being released, (e.g., freeze brands, fin clips, coded wire tags (CWT), or visible implant (VI) tags). Obsolete.

BIOMARK.EXE

An archaic DOS data entry software program used to record tagging, recapture, and mortality events.

BROOD YEAR

A field in a Tagging File used to record the last two digits of the year the eggs were deposited.

CAPTURE METHOD

A field in a Tagging File used to record the method used to collect fish.

CHECKSUM

An (archaic) field in a Tagging File detail record used to record a two-character hexadecimal value that confirms the validity of a 400 kHz PIT tag. Only the PITTAG.EXE and BIOMARK.EXE tag entry programs process this value.

COLLECTION SITE

A field in Mortality Files used to record the six-character code of the denoting the point of collection. Obsolete.

COIL

A loop antenna, made from a coil of wire, which transmits a signal that excites a PIT tag, and then receives a return signal from the PIT tag. Coils or loops are found in all interrogation equipment, from tabletop detectors to automatic interrogation systems.

COIL ID

The unique identifier associated with each coil of automatic interrogation systems.

CONDITIONAL COMMENT

A field in a Tagging File detail record used to record coded references to fish condition, and other key criteria. The PTAGIS Data System will not accept data files containing unrecognized Conditional Comments.

COORDINATOR ID

A field in Tagging Files used to record the (generally) three-character initials of the Coordinator. The Coordinator is responsible for the marking or recovery operation utilizing the PIT tags, and for responding to queries from other entities regarding those operations. Coordinators are not necessarily directly involved in data collection.

CREATION DATE

A field in a Mortality File used to record the date the file was created, and used as the default date of observed mortality. Obsolete.

DETECTOR

A colloquial term used to describe one or more coil assemblies used to interrogate PIT-tagged fish.

DIVERSION GATE

A mechanical gate (such as a slide- or rotational-gate) used to selectively route or segregate fish.

EPA-REACH

See USGS HYDROLOGIC UNIT.

FILE TITLE

The file ID or name given to a PIT tag data file. Each File Title must be unique from all others in the Columbia River Basin and therefore it is very important to follow the formats described in the PIT tag Specification Document for each individual file type. Files containing computer-generated File Title declarations cannot be renamed without also editing the declaration within the file.

FILE TYPE RECORD

This record is present in Tagging and Interrogation files. It designates the format, content, and function of PIT tag data files.

FIXED REFERENCE TAG

A tag having a unique code and an internal clock that is permanently connected inside of the PIT tag monitor and is used to test the performance of individual coils. It receives power from the excitation coil and automatically transmits its code one or more times daily.

FLAG CODE

See Conditional Comment.

FORKLENGTH

A field in a Tagging File detail record used to record the length of a fish from the tip of the snout to the fork of the tail, recorded in millimeters.

GIS HYDRO UNIT

See USGS HYDROLOGIC UNIT.

HATCHERY SITE

A field in a Tagging File used to record a four-character abbreviation of the hatchery at which the fish were reared.

HEADER RECORD

A record found at the beginning of a Tagging File describing parameters global to the detail records in the file.

INTERROGATION FILE

A PIT tag data file created at a monitoring site by the automatic detection equipment and containing (at a minimum) the PIT tag codes, dates and times of interrogation, and the coil IDs on which the tags were interrogated.

ISO

International Standards Organization.

ISO 11784 / 11785

These are the international standards related to the Radio Frequency ID technology used in PIT tags. 11784 defines the 128 bits of the tag telegram message, also referred to as the datagram. 11785 defines the technical parameters of the tag. For example, the ISO tag activation frequency is 134.2 kHz.

MAIN SITE

For the purpose of PTAGIS database reports, specific interrogation sites are classified as a "Main" site. Special database processing occurs for sites that are classified as "Main" sites. Specifically, the first interrogation of a PIT tag at a "Main"site will create an "obs_main" record in the database. Subsequent interrogations of this PIT tag record at other "Main" sites will not generate further obs_main records.

MIGRATION YEAR

A field in a Tagging File used to record the last two digits of the <u>earliest</u> calendar year when fish are expected to smolt and out-migrate to the ocean. In the case of adults and/or recaptured fish, this value will generally reference the current year.

MINIMON.EXE

A software program that provides automated data entry of PIT tag passive interrogation data.

MONITOR

A group of detectors around the same pipe or flume within the same or adjoining shielding boxes, with no gates between them; a set of PIT tag detectors within one shielded unit.

MORTALITY FILE

An obsolete data file input format originally used to report PIT tag mortality events. These events are now recorded and reported to PTAGIS using the standard Tagging File format.

MULTIMON.EXE

A software program that provides automated data entry of PIT tag passive interrogation data. In addition, the MULTIMON.EXE program provides logical control for the operation of fish diversion gates, and includes a "Separation by Code" (SbyC) ability that permits the identification and segregation of individual PIT-tagged fish based on each tag's unique hexadecimal code.

NOTE RECORD

A comment section in a Tagging File. Note records generally pertain to a group of fish instead of an individual fish. The Variable Release Time declaration is the only pre-typed Note Record recognized by PTAGIS.

OBSERVATION

A colloquial name for an interrogation event recorded in an Interrogation File.

ORGANIZATION

A field in Tagging Files used to record the code for the agency or organization responsible for data collection.

PASS-THROUGH REFERENCE TAG

A PIT tag embedded in a wooden block and passed through an interrogation system to determine coil, interrogation unit, and system reading efficiencies. Also called STICK TAGS.

PIT (Passive Integrated Transponder) TAG

A computer chip attached to a wire antenna and encapsulated in a biologically inert glass capsule. The tag is excited when it is passed through the electromagnetic field of a detector and the information on the computer chip is transmitted to the detector.

PITTAG.EXE

An archaic DOS data entry software program used to record tagging, recapture, and mortality events.

PITTAG2.EXE

A 32-bit Windows[™] data entry software program used to record tagging, recapture, and mortality events. PITTAG2.EXE also integrates real-time, context-sensitive, data validation, and complete support for ISO-compatible 134.2 kHz PIT tag codes.

PITVAL.EXE

An archaic DOS data validation program used in conjunction with either PITTAG.EXE or BIOMARK.EXE.

PIT TAG DIVERSION GATE

Any mechanical device used to route or divert PIT-tagged fish. The gate is controlled by a timing device attached to a PIT tag detector.

PIT TAG INTERROGATION SYSTEM

All of the equipment related to exciting, detecting, and on-site recording of PIT tags.

PIT TAG STEERING COMMITTEE (PTSC)

A subcommittee of the Fish Passage Advisory Committee of the Columbia Basin Fish and Wildlife Authority. The Committee is made up of technical representatives of the agencies and tribes. The Committee's function is to provide guidance in the development of tagging methodologies and data standards and to serve as a technical forum for the operation of PTAGIS and the PIT tag data collection and data distribution system.

PIT CODE

A unique 10- or 14-character hexadecimal code recorded on the computer chip in the PIT tag. PTAGIS applications refer to this value as the tag_id.

POSITIONAL COMMENT

A field in a Tagging File detail record used to record specific, pre-formatted codes pertaining to an individual fish. Currently there are predefined values and formats for Species, Run, Rearing Type, and Release Time Variable codes. Individual researchers can designate their own additional positional comments, but the PTAGIS data system will ignore them.

POST TAGGING TEMP

A field in a Tagging File used to record the temperature (C°) of the raceway or live box the fish are held in after tagging but prior to release to a stream. This variable should be left blank if the fish are released to the stream after tagging.

PTAGIS

The PIT tag Information System. This is the central repository of all the information generated by the PIT tag System of the Columbia River Basin. PTAGIS is managed by the Pacific States Marine Fisheries Commission and funded by the Bonneville Power Administration.

PTOC

The PIT tag Operations Center administers the PTAGIS database, operates and maintains all detection equipment at the mainstem Columbia and Snake river dams, and creates and updates data collection software for the Columbia River Basin PIT tag System. Administrative management is through the Pacific States Marine Fisheries Commission.

RACEWAY/TRANSECT

A field in a Tagging File used to record the raceway or transect number or designation used to identify the group of PIT-tagged fish.

REARING TYPE

A one-character code within the Positional Comments section of a Tagging File detail record used to indicate the rearing status (hatchery, wild, or unknown) of a fish.

RECAPTURE

A PIT-tagged fish that is handled subsequent to the release event. A recaptured fish must be designated with the "RE" flag code.

RECOVERY ORGANIZATION

A field in a Mortality File used to record the code of the agency or organization responsible for the collection and reporting of mortality data. Obsolete.

RELEASE DATE

A field in a Tagging File used to record the date that fish are released to a river or stream, to rear or out-migrate naturally.

RELEASE RIVER KM

A field in a Tagging File used to record the location of release, in river kilometers. This is a hierarchical coding scheme from the mouth of the Columbia River to the release site (up to 7th order streams for point release sites) with each tributary delimited with a period. For example, the Release River KM for Lower Granite Dam of 522.173 reflects a distance of 522 km from the mouth of the Columbia River to the mouth of the Snake River, and 173 km from the mouth of the Snake River to Lower Granite Dam.

RELEASE INFORMATION FILE

A Release Information File consists of information about a Tagging File or files that was not available at the time of tagging. Obsolete.

RELEASE SITE

A field in a Tagging File containing the site or body of water that PIT-tagged fish are released into.

RELEASE WATER TEMP

A field in a Tagging File containing the water temperature (C°) in the stream that fish are released into to rear naturally or migrate downstream.

RIVER REACH

See USGS HYDROLOGIC UNIT.

RUN

A one-digit code within the Positional Comments section of a Tagging File detail record used to indicate the season the adult fish return from saltwater (*e.g.*, spring chinook, summer steelhead, etc.).

SEQUENCE NUMBER

A field in a Tagging File detail record containing a sequential number, from 1 to 9999, that individually identifies each Tag Detail record within a Tagging File.

SESSION MESSAGE

A field in a Tagging File used to summarize the purpose and function of the data set.

SPECIES

A one-digit code within the Positional Comments section of a Tagging File detail record used to indicate the species of the fish being tagged.

STICK TAG

See PASS-THROUGH REFERENCE TAG.

STOCK

A field in a Tagging File used to record a brief descriptor of the brood stock, such as "Rapid River" or "Wells".

SWING GATE

A gate positioned in a flume where that flume splits into two. The gate selects one of the two by blocking the other and changes by swinging across the original flume.

TAG DATE

A field in a Tagging File used to record the date the fish were tagged. The various tagging software programs default to the current date and time.

TAG DETAIL RECORD

That portion of a Tagging File containing the PIT code, length, weight, species, race, rearing type, and any comments associated with each individual tagged fish.

TAG SITE

A field in a Tagging File used to record the code (four to six characters) representing the geographic location of the tagging operation.

TAGGER

A field in a Tagging File used to record the last name and initial of the first name of the primary person doing the tag injection for that specific file.

TAGGING FILE

A data file containing information pertaining to the original marking, release, recapture, or mortality of PIT-tagged fish.

TAGGING METHOD

A field in a Tagging File used to record the method of injecting tags into fish. If the data file contains only recapture or mortality information, the Tagging Method is denoted as "NONE."

TAGGING TEMP

The temperature (C°) of the tagging bath during the marking operation.

TEST TAG

A special tag (e.g., STICK TAG, FIXED REFERENCE TAG) registered by PTOC and used to test interrogation efficiency.

TEXTUAL COMMENT

A field in a Tagging File detail record containing an *ad hoc* text descriptor pertaining to an individual fish.

TIMER TAG

See FIXED REFERENCE TAG.

TRANSPORTATION DURATION

A field in a Release Information file used to report the duration of time from loading of fish onto the transport vehicle until they are released into the stream. Obsolete.

TRANSPORTATION TYPE

A field in a Release Information file used to report the method of transport to the release site. Obsolete.

USGS HYDROLOGIC UNIT

An eight-digit code representing the primary through quaternary classifications of geographic mapping in the United States.

VARIABLE RELEASE TIME

A method of assigning multiple Release Dates (and times) to groups of fish within a Tagging File. If groups of fish within a Tagging File are being tagged and released to a stream independently of other groups within the same Tagging File then release date and times must be recorded for each group of fish. This is done with the Release Time Variable, which is a Positional Comment value ranging from 00 to 99. There must be a corresponding Variable Release Time declaration within a Note Record in the Tagging File to define each unique Release Time Variable referenced in the Tag Detail section.

WEIGHT

A field in a Tagging File used to report the weight of the fish, recorded in tenths of grams.

This Page Intentionally Left Blank

Appendix A. Hydrologic Unit Codes

Adapted from Seaber, P.R., Kapinos, F.P., and Knapp, G.L., 1987, Hydrologic Unit Maps: U.S. Geological Survey Water-Supply Paper 2294, 63 p.

A1. Classification System

The United States was divided and sub-divided into successively smaller hydrologic units which were classified into four levels: regions, sub-regions, accounting units, and cataloging units. The hydrologic units are arranged within each other, from the smallest (cataloging units) to the largest (regions). Each hydrologic unit is identified by a unique hydrologic unit code (HUC) consisting of two to eight digits based on the four levels of classification in the hydrologic unit system.

The first level of classification divides the Nation into 21 major geographic area, or regions. These geographic areas (hydrologic areas based on surface topography) contain either the drainage area of a major river, such as the Missouri region, or the combined drainage areas of a series of rivers, such as the Texas-Gulf region, which includes a number of rivers draining into the Gulf of Mexico.

The second level of classification divides the 21 regions into 222 sub-regions. A sub-region includes the area drained by a river system, a reach of a river and its tributaries in that reach, a closed basin(s), or a group of streams forming a coastal drainage area.

The third level of classification subdivides many of the sub- regions into accounting units.

The fourth level of classification is the cataloging unit, the smallest element in the hierarchy of hydrologic units. A cataloging unit is a geographic area representing part or all of a surface drainage basin, a combination of basins, or a distinct hydrologic feature.

A2. Explanation of Hydrologic Unit Codes

An eight-digit code uniquely identifies each of the four levels of classification within four two-digit fields. The first two digits identify the water-resources region; the first four digits identify the sub-region; the first six digits identify the accounting unit, and the addition of two more digits for the cataloging unit completes the eight-digit code. An example is given here using hydrologic unit code (HUC) 01080204:

- 01 the region
- 0108 the sub-region
- 010802 the accounting unit
- 01080204 the cataloging unit

An 00 in the two-digit accounting unit field indicates that the accounting unit and the sub-region are the same. Likewise, if the cataloging unit field is 00, it is the same as the accounting unit.

A3. Hydrologic Unit Names

In addition to hydrologic unit codes, each hydrologic unit has been assigned a name corresponding to the principal hydrologic feature(s) within the unit. In the absence of such features, the assigned name may reflect a cultural or political feature within the unit. All regions and sub-regions are uniquely named; however, the accounting units are uniquely named only within each region, and the cataloging units are uniquely named only within each accounting unit. Duplication of some names at the cataloging unit level is unavoidable because a large number of streams found throughout the Nation share the same names.

A4. List of Hydrologic Unit Codes

These codes cover anadromous salmonid habitat above Bonneville Dam.

Sub- region	Accounting Unit	Cataloging Unit	Name	Area (sq. mi.)

Appendix B. Monitor Naming Standards

B1. Naming Standard for PIT Tag Monitors at Juvenile Fish Facilities

Begin at the first monitor(s) the fish encounter upon entering the facility (generally, this will be at the debris and size separator). To name each monitor, take the first of the following that applies to the monitor's location within the plumbing.

- 1. If the monitor comes directly from the separator, such that all fish leaving the separator through that flume pass through that monitor (with no intervening gates or splits), name it "SEPARATOR".
- 2. If the monitor is not in the PIT Tag diversion system, but leads to any one of the following (trace the pipes and flumes downstream of the monitor), name the monitor after what it goes to:

RACEWAYRaceway(s): If a particular set, append that set's name.RIVERBack to the riverTRUCKTruck loadingBARGEBarge loadingTRANSPORTEither truck or barge loadingEXITBack to the river, or truck or barge loading

If one term completely describes the monitor's location, use it. Otherwise, use all necessary terms to describe the monitor (*e.g.*, RACEWAY/EXIT).

- 3. If the monitor is located between the Corps sample gate and the sample holding tank (the monitor may be before or after the sample head box), name it "SUBSAMPLE".
- 4. If the monitor is between the Corps sample holding tank and the lab, name it "SAMPLE ROOM".
- 5. If the monitor is the first monitor encountered after a PIT Tag diversion gate, name it "DIVERSION".
- 6. If the monitor is in the PIT Tag diversion system, but is not the first monitor encountered, call it "DIVERSION" plus the applicable term(s) from item 2 above (e.g., "DIVERSION EXIT").

Some of these naming conventions will be modified based on certain design features if the facility:

- 1. If there are two parallel paths through part or all of the facility, beginning with the separator, add the prefix "A" or "B" to each monitor in the parallel portion; "A" will be the first encountered by the flow through the separator; and "B" the second (such as "A SEPARATOR", "B TRANSPORT"). If there are more than two parallel paths, continue with "C" and "D", etc. as prefixes. Only use these prefixes for as long as the paths are parallel from the separator.
- 2. If there are two parallel paths through part of the facility, but they diverge from a point other than the separator, include the suffix "1" or "2" to each monitor in the parallel portion; "1" will be the first encountered by the flow into the parallel sections, "2" the second (e.g., "DIVERSION 1", "DIVERSION 2"). If there are more than two parallel paths, continue with "3", "4", etc. Only use these suffixes for as long as the paths are parallel.

- 3. If the monitor controls a diversion gate, suffix "GATE" to the monitor. NOTE: If there are several coils in line, some controlling a diversion gate and others not, those that control the gate should be designated as a separate monitor from the others.
- 4. Abbreviations may be used to shorten the name of a monitor, providing the abbreviations are commonly know (e.g., "E" for "EAST") and do not create a situation where two monitors have the same name.

B2. Naming Standard Example

At Little Goose, there are 10 monitors. The first four coming from the separator are two 2-coil units that control the diversion gates and an additional 2-coil unit in line with each of the first. These are parallel; two are gate controllers. They are called "A SEPARATOR", "A SEPARATOR GATE", "B SEPARATOR", and "B SEPARATOR GATE".

Continuing down the undiverted path, each side has a monitor just after the Corps sample gates. The flow from these monitors can be sent to the raceways, truck loading, barge loading, or to the river. Since they are still parallel; these monitors are called "A RACEWAY/EXIT" and "B RACEWAY/EXIT".

Going down the diversion system, the flumes which carry the fish from the diversion gates lead to separate head boxes, then down separate pipes with monitors to holding tanks. Since these are also parallel, they are called "A DIVERSION" and "B DIVERSION".

There is one more monitor in the diversion system; this one leads to truck loading, barge loading, or to the river. The two sides come together before this monitor; therefore it is called "DIVERSION/EXIT".

The last monitor is in the Corps Sample; it leads into the lab, after the holding tank. It is called "SAMPLE ROOM".

Appendix C. Interrogation Site Configurations

This appendix contains diagrams of Interrogation Sites currently maintained by the PIT Tag Operations Center (PTOC), and the complete configuration history for all Interrogation Site data defined in the PIT Tag Information System (PTAGIS). If you need additional information about any Interrogation Site, please contact PTOC.

C14. Site Configuration History

PIT Tag System Codes are assigned by the agency maintaining the monitoring equipment. During 2001, the majority of the monitoring equipment will be maintained by PTOC. Therefore, any questions, changes, or corrections should be addressed to that entity.

2001 PIT Tag Specification Document

F1. Overview of PTAGIS DBMS Schema

F2. Field Data Load (FDVL) Sub-Schema

The PIT Tag Operations Center (PTOC) runs processes that incorporate the "raw" Tagging and Release Information Files, as defined in this Columbia River Basin PIT Tag Information System Data Source Input Specification (a.k.a., the SpecDoc). PTOC refers to these processes as the FDL processes. These processes are currently initiated manually in order to assure that the process does not over-load system resources, does not interfere with other PTAGIS processing and to assure successful completion of the load event. The following describes the main tables that are updated during the operation of the FDL processes.

FDVL Tables: tag_data, tag_hdr, mort_data, mort_hdr, recap_data, recap_hdr

Table Functions:

tag_data:

The tag_data table contains one record per fish that is released in the Columbia River drainage. This record is contained in a Tagging and Release Information File (Tagging File) that is submitted by PTAGIS system users. The *tag_file* field in the tag_data table contains a reference to the Tagging and Release Information File submitted by PTAGIS users. There are one or more tag_data records for each *tag_file*.

Special Notes:

Recapture and Mortality information are assigned to individual fish using the flags attribute (See "Conditional Comments (Flag Codes)" on page 20).

If a fish is marked with an RE Flag Code, then this fish record is written to the recap_data table and the tag_header information associated with this tag_data record is loaded to the recap_hdr table (if it does not exist there already). Likewise, if a fish is marked with any of the mortality flag codes, (*e.g.*, M, MB, MK, MS, SM), then a mort_data record is created with this tag_id and a corresponding mort_hdr record is created based upon associated information.

Fish that die during recapture must be reported with flag codes of RE and M (this means recapture, mortality). The tag from this fish cannot be used again. Records with RE M flags will generate corresponding records in the mort_hdr, mort_data, recap_hdr and recap_data tables.

Adult fish that are recaptured at hatcheries should have RE RF flag codes. The RE flag code will assure that a record is inserted into the recap_hdr and recap_data tables. The RF flag will be used to report the adult return in the "Final Disposition Analysis" reports that will provide life-cycle information for each tagged fish.

tag_hdr:

Each tagging file that is submitted to PTAGIS generates one tag_hdr record. This record contains information related to all fish contained in the Tagging File.

mort_data:

Fish records in a Tagging File that are marked with a mortality flag code (M, MB, MK, MS, SM) generate a single mort_data record. Tags from fish that died after marking and prior to release can be reused. In this case, the tag_id for the fish that died should either be "dotted out" or removed from the Tagging File.

mort_hdr:

One mort_hdr record is created for a collection of one or more mort_data records. The mort_hdr record is "cloned" from the tag_hdr record in a Tagging File.

recap_data:

A recap_data record is generated for tagging records that are marked with an "RE" flag code. A fish may be recaptured many times, so there may be many recap_data records for the same tag_code.

recap_hdr:

One recap_hdr record is created for a collection of one or more recap_data records generated from the same Tagging File. The recap_hdr record is "cloned" from the tag_hdr record created from information in the Tagging File.

F3. Interrogation Data Load (IDL) Sub-Schema

The PTOC runs processes that incorporate the "raw" Interrogation Files, as defined in the Spec Doc. PTOC refers to these processes as IDL processes. The IDL processes are initiated automatically at 00:05, 06:05, and 12:05 daily. The following describes the main tables that are updated during the IDL processes.

IDL Tables: obs_data, obs_site, obs_main, obs_by_day

Table Purpose:

obs_data

Each row in the obs_data table corresponds to one "fish" record in a 'raw' interrogation file (either the new "MULTIMON" file type, or the traditional "INTERROGATION" file type). If a single fish generates 20 interrogation records, then 20 fish records will be inserted to the obs_data table.

"Fish" records are distinguished from "test tags" during the load process of an interrogation file by probing the test_tags table for a matching tag_id. If a match is found in the test_tags table, then the corresponding interrogation record is not loaded into the obs_data table, but instead is loaded into the test_tag_data table. Other records in an interrogation file that are not test_tag records or fish records are diagnostic of the interrogation system at the site, or descriptive of the site itself.

As IDL processes fish records from interrogation files, it not only inserts a new record to the obs_data table, but will update or insert new records into the obs_site table, obs_main table and the obs_by_day table. These tables contain a single summary record for each distinct fish record (tag_id) as appropriate.

obs_site

The obs_site table contains a single record for each each fish seen at each interrogation site. For example if the fish was seen at the Snake Trap (SNJ), Little Goose (GOJ), Bonneville Powerhouse 2 (B2J) and at the Lower Granite Adult Ladder, then the obs_site table will contain 4 records with the unique tag_id of the fish. These records contains the first interrogation date and time of this fish at associated site and the coil identifier (location within the site) where this fish was seen. In addition, it contains the last interrogation date and time that this fish was seen at this site in addition to the last coil identifier that 'saw' this fish. In addition, a count of the total number of 'coil hits' is accumulated that indicates the number of times this fish was seen on any coil. If a fish was seen on coil 01, coil 02, on coil 01 again and finally on coil 03, then the intrgn_count will record four coil hits fish at this site.

obs_main

There are zero or one records in the obs_main table for any tag_id record that exists in the tag_data table or obs_data table. If the fish is never interrogated at a "Main Site", there will be no matching record in obs_main. If the fish is seen at one or more main interrogation sites in the river system, there will be exactly one record for this fish in the obs_main table.

The advantage of this summary table is that it records only the first interrogation of the fish at any "Main Site". This table is maintained in order to provide faster reporting of "First Obs Main" reports. The First Obs Main reports show only the first interrogation of a fish as it migrates down stream. This allows the user to determine what percent of a fish release was seen first, for example, at Lower Granite, Little Goose, Lower Monumental, Bonneville, etc. The PIT Tag Steering Committee determines which sites are designated as "Main Sites". This designation is stored in the PTAGIS database in the Site Configuration Management Schema of PTAGIS.

In addition to tracking the first main site that the fish was seen at the obs_main table keeps track of the last main site that a fish was seen at. The first time that the fish was seen, the first obs site and the last obs site (and corresponding date and time stamps) are set to the same value. When the fish is seen at subsequent main sites, the record for this fish is updated to reflect the last place and time that this fish was seen.

obs_by_day

The obs_by_day table contains a single record for each fish seen at each site. This summary table contains only the date that the fish was first seen at this site; it does not include the time stamp. If the fish was seen at 23:57 on May 31, 1998 and then at 00:14 on June 1, 1998 at Lower Granite Dam then the obs_by_day table contains a single record that shows this fish on May 31, 1998. This table also contains the name of the interrogation file where this fish was first seen on this date.

This table is used to generate the obs_by_day reports. The obs_by_day reports list the number of fish seen at an interrogation site, by species, run and rearing_type on the given day.

F4. Test Tag (TST) Sub-Schema

Test Tags are tags that are used to test interrogation and tagging system components. Test tags should not be counted as fish. Test tags are specifically registered to PTAGIS and recorded in the test_tags table.

There are two types of test tags: fixed reference tags and variable reference tags. Fixed reference tags are also known as "timer tags". These tags are assigned to a specific coil at an interrogation site. These tags will emit a unique code at periodic (usually every four hours) intervals. Absence of the fixed reference tags at an interrogation site indicates the failure of a system component or the specific antenna coil. Fixed reference tags MUST be registered with a specific interrogation site_code and coil_id.

The variable reference tags are also called stick tags. Stick tags are, by tradition, wooden sticks with PIT tags embedded in one or two ends. These tags are used by system maintainers to test the operation of interrogation coils throughout the system. The stick tags are usually floated in the fishway (usually a flume) through the interrogation coils. The sticks are recovered and used to test other coils. Stick tags are differentiated from timer tags in that they are not assigned to a specific coil_id or interrogation site_code.

TST Tables: test_tags, test_tag_data

Table Purpose:

test_tags

The test_tags table is the registration table for tag_ids that are specifically not to be identified as fish. This table implicitly differentiates fixed reference tags from stick tags by assigning a site code and coil_id to fixed reference tags. The IDL process updates the last_load_int_count with the number of times that the fixed reference tag was seen at the interrogation site, for each time that the IDL process loads data from this site. If the last_load_int_count is zero, then the coil is listed on the "Timer Tag Exception Report". Otherwise, the last_load_int_count is used to display the number of timer tag hits on the "Timer Tag Report".

test_tag_data

Any tag_id that is registered in the test_tags table and is processed during operation of the IDL is inserted into the test_tag_data table. This table is useful for verifying operation of facilities at some time in the past, by identifying operation of timer tags or by verifying testing via diagnostics generated by a maintenance technician using test tags.

F5. Site Configuration Management (SCM) Sub-Schema

The Site Configuration Management Schema provides PTAGIS the capability to maintain change history at interrogation sites. For example, McNary (MCJ) installed a new facility that went on-line in 1994. However, prior to that, MCJ was operating a four-monitor interrogation facility. The SCM tool was used to construct a configuration sequence number for the original McNary facility and a subsequent configuration sequence number for the new facility.

The SCM tool maps coils within monitors (collections of coils) to interrogation sites that can change over time.

Interrogation data stored in obs_data and obs_site and obs_main link to specific configuration sequence numbers (cnfg_seq_nbr) found in the SCM schema.

SCM Tables: site, monitor, site_coil

Table Purpose:

site

The site table describes the site. Information about a site includes its long description, site_code, whether or not it is a main site, the current configuration sequence number of the site and other information used by IDL and report sorting processes.

monitor

The monitor table describes monitors (monitors are collections of one or more coils). Monitors are associated with a configuration (they can be added, changed or removed over time) and so they maintain a cnfg_seq_nbr. Monitors can be associated with entry into a fish collection system, or exit from a fish collection system.

site_coil

The site_coil table associates a coil to a monitor for a specific configuration. Each coil within an interrogation site (and current configuration) is unique. The contr_id (controller identifier) is obsolete.

F6. Validation SubSchema (VAL)

Two tables are used to validate user input to PTAGIS in conformance with the Spec Doc.

VAL Tables: rkm, valid_tbl

Table Purpose:

rkm

The rkm table contains the list of valid tagging, release and recapture site codes, associated river kilometers, a revision date and associated messages for administrative and tracking purposes. New entries to this table are submitted by members of the PIT Tag Steering Committee.

valid_tbl

The valid_tbl contains a set of domains (e.g., TAG COORD, FLAG CODE) and the associated short code name and the description of the code. These codes are approved by the PIT Tag Steering Committee.
